Chapter 1

Don't Starve Together - Dedicated Server

- To play on the Dont Starve Together server, start the game on Steam, then look for the server named "wonderland"
- Streaming live to twitch.tv/s1y_b0rg
- Clone this repo onto your game server.
- Create a dedicated user for the game, such as `dst`.
 - make the repo clone the home directory of the new `dst` user.

1.1 Install `direnv`

- We will use `direnv` to pick up the secret token from an environment variable.
 - `install direnv`

```
curl -sL https://direnv.net/install.sh | bash
eval "$(direnv hook bash) "
```

Now create a file called `.envrc` in this top level folder. It should have one line in it like so:

```
export CLUSTER_TOKEN="pef-g^KU_QrGp3bke^uerRdBrRFyKING2q9zypelrosOjFYclg="
```

1.2 Edit config files

- Edit the `files in the top level ./saves directory`
 - These will be copied into place by the scripts later.
- There is `a new script` to generate the `saves/modoverrides.lua` file.
 - It just got tedious recreating it by hand every time we wanted to test a new server side mod.

1.3 Crontab Entry

You can cause the gamse server to update itself at a time when you should probably be sleeping. Use the `crontab -e` command to add this line to your `dst` service user crontab:

```
0 4 * * * /usr/games/steamcmd +login anonymous +app_update 343050 validate
+quit
```

1.4 Run Scripts

These two scripts set up the environment and start the game server.

```
./bin/bootstrap.sh  
./bin/run_dedicated_server.sh
```

1.5 Troubleshooting

1.5.1 Mod had no modworldgenmain.lua. Skipping.

That means that mod (or mods) are no longer compatible with the current version of DST; or the files have become corrupt (which can happen even if others use the same mod without issue).

You're going to need manually remove the mods from your game files (this happens quite often). This is an easy fix!:

- Turn off auto-subscribe, if you have it on.
- Unsubscribe from ALL mods, that are showing "workshop-xxxxxxx" for you, on the Steam Workshop page.
- Go into your "Don't Starve Together" file/folder and manually delete ALL of those mods.
 - manually delete ALL: "workshop-<number>" directories from your steamapps\common\Don't Starve Together\mods directory.

Finally, you begin the process of adding those mods back in, one at a time, until you find the one(s) causing the issue.
